

Utility Patent
Ser. No. 09/833,978

**PLEASE INCLUDE THE FOLLOWING CLEAN VERSION OF THE SPECIFICATION
CHANGES PURSUANT TO 37 CFR 1.121(B)(2)(ii)**

Please replace the first, second and third paragraphs beginning on page six, line five, and ending on page seven, line one, with the following three paragraphs:

B1
Q3
-- Referring now to FIG. 2 and FIG. 3, the housing pivotally supports the rocker switch 18 about a pivoting axle 40. Having a pair of flat, acutely intersecting touching surfaces 42 about the upper portion of the rocker switch 18, the lower portion is a cam-shaped arcuate body 44. A first electrically conductive contact 46 is supported along one side of the body 44; a second electrically conductive contact 48 is affixed at one end in electrical communication with receptacle connectors 16a and at an opposite end is biased toward one side of body 44 such that as the rocker switch 18 is articulated, the first electrical conductive contact 46 engages the blade connector 14 at one end and engages a second electrical conductive contact 48 at an opposite end, thereby creating electrical continuity between the receptacle connectors 16a, through the second contact 48 to the first contact 46 and to the blade connectors 14.

It is envisioned that parallel switching conductors of identical configuration are mounted about the body 44 such that each receptacle connector 16 is switched between electrical continuity to a respective blade connector 14.

Should an electrical interrupt switch 10 be configured for receiving a ground connector 16b, a ground prong 15 would be in continuous electrical communication therewith such that ground continuity is not effected by position or operation of the rocker switch 18. --
